Lab sheet 5

Do the following statements in Casandra and draft a report with screenshots and your own explanation wherever necessary.

| docker runname medtech-cassandra -d cassandra:latest docker exec -it medtech-cassandra cqlsh create a keyspace: CREATE KEYSPACE mykeyspace WITH REPLICATION = { 'class' : 'SimpleStrategy', 'replication_factor' : 1}; see all keyspaces: describe keyspaces; use the keyspace: use mykeyspace ; create table: create table users(user_id int primary key, fname text, lname text); |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| docker exec -it medtech-cassandra cqlsh create a keyspace: CREATE KEYSPACE mykeyspace WITH REPLICATION = { 'class' : 'SimpleStrategy', 'replication_factor' : 1}; see all keyspaces: describe keyspaces; use the keyspace: use mykeyspace ; create table: |
| create a keyspace: CREATE KEYSPACE mykeyspace WITH REPLICATION = { 'class' : 'SimpleStrategy', 'replication_factor' : 1}; see all keyspaces: describe keyspaces; use the keyspace: use mykeyspace ; create table: |
| CREATE KEYSPACE mykeyspace WITH REPLICATION = { 'class' : 'SimpleStrategy', 'replication_factor' : 1}; see all keyspaces: describe keyspaces; use the keyspace: use mykeyspace ; create table: |
| CREATE KEYSPACE mykeyspace WITH REPLICATION = { 'class' : 'SimpleStrategy', 'replication_factor' : 1}; see all keyspaces: describe keyspaces; use the keyspace: use mykeyspace ; create table: |
| 'replication_factor': 1}; see all keyspaces: describe keyspaces; use the keyspace: use mykeyspace; create table: |
| describe keyspaces; use the keyspace: use mykeyspace; create table: |
| describe keyspaces; use the keyspace: use mykeyspace; create table: |
| use the keyspace: use mykeyspace; create table: |
| use mykeyspace ; create table: |
| use mykeyspace ; create table: |
| create table: |
| |
| create table users(user_id int primary key, fname text, Iname text); |
| |
| |
| show all tables in the keyspace: |
| describe tables; |
| |
| insert values: |
| INSERT INTO users (user_id, fname, Iname) VALUES (1745, 'john', 'smith'); |
| |
| see inserted values: |
| select * from users; |

```
read requests (see the results)
select * from users where user_id < 2000;
select * from users where user_id = 1745;
select * from users where Iname = 'smith';
indexing columns:
CREATE INDEX ON users (Iname);
SELECT * FROM users WHERE Iname = 'smith';
Create a table with composite key:
CREATE TABLE tab2 (
    id1 int,
    id2 int,
    first_name varchar,
     last_name varchar,
     PRIMARY KEY (id1, id2));
Add a new column to the table:
ALTER TABLE users ADD telephone text;
Alter the value of a row:
UPDATE users SET telephone = '21212121' where user_id = 1745;
 Empty a table:
 TRUNCATE users;
 Delete a table:
 DROP table users;
 Create a table with sets:
 CREATE TABLE users (user_id int PRIMARY KEY, fname text, Iname text,emails set<text>);
 Insert values in a set:
```

```
INSERT INTO users (user_id, fname, lname, emails)VALUES(1234, 'Frodo', 'Baggins',
{'f@baggins.com', 'baggins@gmail.com'});
Add an element to a set:
UPDATE users SET emails = emails + {'fb@friendsofmordor.org'} WHERE user_id = 1234;
Extract email addresses:
SELECT user_id, emails FROM users WHERE user_id = 1234;
Delete an element from the set:
UPDATE users SET emails = emails - {'fb@friendsofmordor.org'} WHERE user_id = 1234;
 To delete all elements:
 UPDATE users SET emails = {} WHERE user_id = 1234;
 DELETE emails FROM users WHERE user_id = 1234;
 create a list:
 ALTER TABLE users ADD top_places list<text>;
 insert elements in the list:
 UPDATE users SET top_places = [ 'rivendell', 'rohan' ] WHERE user_id = 1234;
 to add a new element in the list:
 UPDATE users SET top_places = top_places + [ 'mordor' ] WHERE user_id = 1234;
to insert an element at a given position (old value will be replaced):
UPDATE users SET top_places[1] = 'riddermark' WHERE user_id = 1234;
delete an element from the list, using its index:
DELETE top_places[2] FROM users WHERE user_id = 1234;
delete all elements with a given value:
UPDATE users SET top_places = top_places - ['riddermark'] WHERE user_id = 1234;
```

create a map:

ALTER TABLE users ADD todo map<timestamp, text>;

insert an element in the map:

UPDATE users SET todo = { '2012-9-24' : 'enter mordor', '2012-10-2 12:00' : 'throw ring into mount doom', toTimestamp(now()): 'die!'} WHERE user_id = 1234;

insert a specific element by id:

UPDATE users SET todo['2012-10-2 12:00'] = 'throw my precious into mount doom' WHERE user_id = 1234;

replace the whole map with insert:

INSERT INTO users (user_id,todo) VALUES (1234, { '2013-9-22 12:01' : 'birthday wishes to Bilbo', '2013-10-1 18:00' : 'Check into Inn of Prancing Pony' });

delete an element in the map:

DELETE todo['2012-9-24'] FROM users WHERE user_id = 1234;
